Frontend (currently implemented)
RegisterAccount (User)

- Register account generates a page with the following elements:
 - EditText: Email
 - EditText: Password
 - EditText: Confirm Password
 - Button: Login
 - Button: Signup
- Upon clicking Login, it goes back to the login screen (starting screen)
- Upon clicking Signup, the values of Email and Password are sent as a POST request to the server.

Login (Admin, User, Organization)

- Login generates a page with the following elements:
 - EditText: Username (Email)
 - EditText: Password
 - Button: Login
 - Button: Signup
- Upon clicking Login, the values of Username and Password are sent as a GET request to the server, and returning true if the credentials are in the server, and returning false if otherwise
- Upon clicking Signup, it will take you to another screen where you can register a user

Backend

Communication (to send data):

- **Get:** mainly used to retrieve data from the server (db)
- **Delete:** mainly used to delete simple data that can be parsed over url
- **Post:** mainly used to update existing data in the DB, or to delete complex data
- **WebSocket:** mainly used to communicate in real time between users or between users and the server.

Controllers (to handle data manipulation):

- **LoginController (“/login”)** confirms login information with DB.
- **SignUpController (“/signup”)** creates the user in DB using JSON data provided by the user
- **SellPostController:** handles CRUDL on postings (listings) in DB
- **ImageProcessingController:** handles saving image
- **Auction (WebSocket):** directs users towards certain auction
- **DirectChat(WebSocket):** directs a user to a specific user
- **MeetingLocationController:** handles CRUD of meeting locations in DB
- **AdminController:** handles CRUD of announcements to all users in DB, also sends out announcements to the users
